10. GC2603 presser bar and drawing bar	35~36
11. GC2301 top feed mechanism	37~38
12. GC2603 top feed mechanism	39~40
13. Lubrication mechanism	41~42
14. Knee lifter mechanism	43~44
15. Accessories	45~46

1. Brief introduction

GC2301 and GC2603 cylinder bed series sewing machine are constructed with single straight needle, needle roller lever thread take-up, precise spiral gear transmission, twice big rotating hook and reverse feeding stitching mechanism. Both models feature stable and beautiful stitching, small force moment, low noise, smooth feeding of multilayer and uneven workpiece. And they are widely used in factories of garments, leathers, suitcases, shoes and caps. The cylinder beds are designed for various curved and rounded articles.

Difference between GC2301 and GC2603:

GC2301 features top&bottom feed, which is consisted of walking presser foot and feed dog. Top and bottom can be either synchronized to avoid slippage of slippy and bulgy workpieces, or differential for sewing of pleats.

GC2603 features compound feed, which is consisted of presser foot, needle and feed dog. This feed mechanism eliminate slippage between layers and can supply smooth sewing of elastic or slippy multilayer workpieces. Another advantage is the presser foot which is very close to the needle, this design make sewing easy for pleats, folds and tubes overseaming.

2. Main specifications

Model Specs	GC2301、GC2603
Max speed	2000 rpm
Presser foot lift	6.5mm by hand >13mm(by knee)
Sewing thickness	8mm for pu(less than 8mm for uneven articles
Needle	DPx17 18 [#] ~24 [#]
Rotating hook	Twice big rotating hook
Motor	370w, 1440 rpm(special Motor for sewing machine)

3. Machine installation and operation preparation

3.1 Machine installation

3.1.1 Location for installation

Machine should always be located on rigid flat floor to ensuring smooth running and little vibration. Rubber mats should be applied under machine stand for smoother running and lower noise.

3.1.2 Setting up the machine base

First of all the knee lifter pushing rod sleeve will be set into the table and fastened(see fig on page 44). Insert small oil pan into the bottom of machine base. Match the 4 screw holes in the machine base with the 4 of the table, and then screw with 4 bolts A..

Insert the knee lifter pushing rod B. In to the position hole in the machine base (fig.1).Micro-adjust the base to make rod B move freely in sleeve before fasten the 4 bolts A.

3.1.3 Installing the machine head (fig.2)

Fasten one side of the hinge on machine base. Then place the machine head on base and adjust position to make the 3 screw holes in the machine head fall exactly on the 3 ones in the other side of the hinge. Fasten with 3 bolts A.

3.1.4 Installing the rockshaft bracket of knee lifter

See illustration on fig.3 and page 43.

1) Knee lifter handle 18 can be adjusted for a comfort position, slight force and a proper swing angle as per the body of operator.

2) Adjust position of knee lifter assembly as per fig.3, and then fasten rockshaft bracket 7. With screws 6.

3.1.5 Installing the motor (fig.4)

Adjust motor C in horizontal direction to line the balance wheel belt groove with motor wheel groove. Be sure the belt doesn't touch the table.

3.1.6 Connecting the clutch rod with pedal (fig.5)

1) Angle of pedal with floor should be $20^{\circ} \sim 30^{\circ}$

2) Adjust the clutch of the motor so that clutch lever C. And draw bar B. Run in line.

3) The balance wheel should rotate anticlockwise when face the balance wheel, the motor should rotate in the same direction. Motor can run in reverse direction if power supply are overturned

4) Tension of V-belt can be adjusted by change the height of motor.

Proper tension should cause span 10-12mm closer when press with fingers.

3.1.7 Installing the bobbin winder (fig.6)

Keep the winder pulley B. Align with belt while a clearance in between exist, and make sure they can touch each other when lever A. Is depressed—Thereby the winder pulley can be driven by belt when machine is running. Once again please take notice the bobbin winder should parallel with belt slit E before you fasten the 2 screws D.

3.1.8 Installing the thread stand (fig.7)

The thread stand should be erected on the left rear of the table. Threading should be smooth during sewing, the spool and stand should not be hit when the machine is pull down. Fasten the screw C. After position is okay

3.2 Preparation

3.2.1 Cleaning the machine

Every machine is oiled and greased to prevent rust before packing in the factory. This may cause grease coagulated and dust gathered on the machine during storage and shipping. So please clean grease and dust with gasoline and clean rags when you open the packing.

3.2.2 Examination

Although the machine is examined and tested carefully before delivery, some parts of the machine may be loosed or deformed by bumps and shakes in shipping. So a though examination is necessary after cleaning.

Turn the balance wheel to check if there be any running obstacle, bumps, other uneven forth or abnormal noise. Any of these should be corrected or solved before running.

8b

3.2.3 Lubrication

Parts marked by arrows (fig.8) need to be oiled before machine is run.

Oil no less than twice for each shift when the machine continues in operation. Only HA-8 or TJ-7 sewing machine oil should be applied

8c

9

Oil applied to hole A is distributed to parts F, G, H, I and J through oil wick (fig.9)

Oil applied to hole B is distributed to parts C, D and E through oil wick (fig.10)

Gear case (fig.11) is filled with fine crease, which will be consumed during operation. Replenishment should be made periodically as bellows:

Turn off plug K, add crease into the 2 screw holes, and then insert the plug. If remained crease in gear case is dirty, thorough replenishment should be made.

3.2.4 Trial run

Trial run is required for a brand new machine or a machine laid aside for a long term. Be sure the balance wheel rotates anticlockwise when face the balance wheel. Lift the presser foot, run in a low speed at first to check if everything is okay. Then speed up to 2000 rpm. Double check each part after several minutes' running. If everything is okay, the machine can be put into use.

4. Operation

4.1 Selection of the thread

Needle should be applied with left-twisted thread. Bobbin thread can be either left or right twisted.

To identify the twist direction of a thread as bellows:

Hold the thread as shows. If the thread turns to be tight, the thread is left-twisted. Otherwise it's right-twisted.

4.2 Match the needle with thread and workpiece

Please use needle DPX17,18#~24#. Select proper needle size in this range for different workpieces as per table as following.

Needle Spec (Nm)	Thread and spec	Workpiece processable
110(18#)	Cotton thread 19.5~14(30#~42#)	Canvas, thick wool fabrics and etc.
120(19#)	Poly thread 14.5~9.5(40#~60#)	PU, leather and denim
125~180(20#/24#)	Poly, Mercerized thread 19.5~9.5(30#~40#)	Thick denim, PU, leather and suitcase

4.3 Installing the needle (fig.13)

Turn the balance wheel until the needle bar at its highest point. Loosen needle setscrew 1. Insert the needle shank completely into the hole in the needle bar, make sure the needle groove turn to left of operator, and tighten the setscrew.

Note: Fig.13(b) incomplete insertion, and Fig.13(c) Wrong direction of needle

4.4 Winding the bobbin thread

1) Winding instruction (fig.14)

Insert bobbin A. Onto the bobbin winder spindle B.

Pass thread C. From the spool through eye 1 on thread guide E, then pass it between the tension discs 2, wind the thread onto bobbin for several turns. Press stop latch D to lock the winder pulley F on the belt G.

Start the machine to wind the bobbin. The machine will stop by it self when the bobbin is fully wound. Be sure to keep the presser foot lifted when you are winding without sewing.

2) Winding adjustment (fig.15)

The bobbin thread should be neat and tight. If it's not tight enough, adjust the thread tension by turning tension regulating screw A. If it's not neat, adjust the position of thread guide C. As this: Loosen thread guide setscrew B, move the thread guide rightward if thread gather as Fig.15(b). Move leftward if thread gather as fig.15(c). Tighten screw B when thread is wound as fig.15(a).

Note: Strong thread like nylon or polyester should be wound with light tension to prevent the bobbin being destroyed.

Bobbin should not be over filled to prevent from loosening down (fig.15(d)). A perfect winding is 80% get filled. And this can be adjusted by stop latch screw E.

4.5 Threading the needle and drawing the bobbin thread

Threading the needle as bellows:

Raise the needle bar to its highest point, lead the thread from the spool and pass it in the order illustrated in fig. 16.

1) Lead the thread from the spool through the right hole in the thread guide 1, then through the two tension discs and pass through the left hole in the thread guide.

2) Then lead to left through the thread retainer 2 as illustrated.

3) Pass down through between two tension discs 3.

4) Then through the hook of thread take-up spring 4.

To left pass through thread guide 5 and 6. Then lead through the hole of thread take-up lever 7.

5) Turn down to pass thread guide 8, then the thread guard 9 on the needle bar bushing (lower) (On the machine Model 2603 is the lower thread guard) and needle bar thread guide 10. Then pass the thread from the left thru the eye of needle 11, draw out the thread from the needle eye by about 100mm.

Drawing the bobbin thread as bellows:

Raise the needle bar to its highest point, hold the needle thread and turn the balance wheel to make needle bar to lowest then highest again. Pull the needle thread then bobbin thread is drawn up. Put both thread under the presser foot.

4.6 Inserting the bobbin (fig. 17)

Put bobbin B. Into bobbin case, pass thread E thru slit C to lead it underneath the bobbin case tension spring D and out at the notch of the spring, draw out thread about 100mm.

Note: The bobbin case must be rotating clockwise when thread E is drawn. If not, reverse bobbin B.

4.7 Inserting and removing the bobbin case (fig.18)

Insertin

Raise the needle bar to its highest point. Open the hook cover A. Insert bobbin case C into rotating hook B as shown in fig.18. Make sure that the bobbin case latch D is engaged in the position groove of rotation hook spindle.

Removing

Open the hook cover fully, hold it by ringer carefully to prevent the bobbin from dropping out of the case. Then take out the bobbin.

4.8 Adjusting the stitch length and reverse stitching (fig.19)

Stitch length can be adjusted by regulating dial 1. Turn it anticlockwise to make stitch length bigger, or the reverse for smaller.

Press down reverse lever 2 to get reverse feed stitching. Loose it to shift back to normal feed stothing.

5. Thread tension

Thread tension should change with different workpiece and thread.

In practice, thread tension is examined by stitches obtained.

Needle thread tension should be adjusted with reference to the bobbin thread tension, which can be adjusted by turn the rubber screw A. On the bobbin case illustrated in fig.20

Normally the bobbin thread tension can be checked as fig.21 shown.. In case a 14 tex (42s) T/C string is applied as bobbin thread, The proper thread tension should allow bobbin case drop slowly by holding thread to swing up and down.

Needle thread tension can be adjusted by changing tension of the thread take-up spring, stroke of tension spring, tension of tension discs and the position of thread guide. All these adjustments will be described as follow.

5.1 Adjusting the thread take-up spring (fig.22)

The normal tension of the thread take-up spring is approx. 25~30g, and spring stroke is 5~8mm. For sewing light weight workpiece (small stitch length), weak the spring tension and widen the spring stroke. Do opposite for heavy duty sewing.

5.1.1 Adjust the tension of thread take-up spring (fig.22)

Loosen tension stud setscrew A. To free tension stud B. Turn B clockwise to enlarge spring tension, the reverse to reduce tension. Fasten setscrew A after adjustment.

Proper spring tension is approx. 45g, which can be obtained as bellows:

Loosen A first, then turn B anticlockwise to make spring tension zero. Continue to turn B anticlockwise until thread take-up spring C touch edge of the thread take-up spring regulator. Finally turn B 180 clockwise and tighten setscrew A.

5.1.2 Adjust the stroke of thread take-up spring (fig.23)

Loosen tension stud setscrew A. To free tension stud. Turn tension regulator C clockwise to enlarge spring stroke, the reverse to reduce spring stroke.

Normally, the thread take-up spring tension is properly adjusted before delivery, so no need to adjust it unless special workpiece or unusual thread is applied.

Thread guide position	Leftward	Center	Rightward
			
Material	Heavy	Medium	Light

5.2 Adjusting the thread guide

The position of the thread guide affects sewing quality, so it must be adjusted according to the materials to be sewn.

5.3 Adjusting the tension of needle and bobbin thread

Fig.24 shows the various type of stitch forms probably obtained during sewing.

Normal stitch form should be as shown in fig.24a. While abnormal stitches causes crinkle, loose or breakage of stitches which must be adjusted as bellows:

Fig.24b shows the needle thread tension is too strong or the bobbin thread tension too weak. Turn tension stud screw anticlockwise to make needle thread get less tension, or tighten the rubber screw on bobbin case to make the bobbin thread get more tension (fig.25)

Fig.24c shows the needle thread is too weak or the bobbin thread tension too strong. Turn tension stud screw clockwise to make needle thread get more tension, or loosen the rubber screw on bobbin case to make the bobbin thread get less tension (fig.26)

Fig.24d shows both needle and bobbin thread tension too weak, while fig.24e shows both tension too strong. Adjustment can be made with reference to the above means

6. Adjustment of the machine

6.1 Needle-to-hook relation

6.1.1 Adjusting the needle bar height (fig.27)

Turn the balance wheel to locate needle bar at lowest position. Remove the rubber plug (GC2301) or face plate (gc2603), then loosen needle bar joint screw A. Move needle bar vertically to make center of needle eye D coincide with inside circumference E of rotating hook. Tighten screw A, put on the rubber plug of the face plate.

6.1.2 Adjusting the timing between the needle and the hook (fig.28,29)

Turn the balance wheel to make needle B at lowest position then 2.5mm up. At this position, the hook blade D should coincide with needle center C, and blade D is 1.2mm above upper edge of needle eye E. (See fig.28)

When adjusting the timing between needle and hook, make sure notch on lower side of needle D has a clearance about 0.05mm with the hook blade C. (see fig.29)

6.1.3 Removing and installing the rotating hook

Lift the presser foot and raise needle bar to its highest position. Remove the sliding ring. The bobbin case, guard ring, throat plate, feed dog, hook position bracket. Turn the balance wheel and loosen the 3 setscrews D of the rotating hook. After this take it out carefully.

Install the rotating hook can be done by reverse sequence.

6.1.4 Adjusting the clearance between hook blade point and hook positioning bracket (fig.30)

The projecting flange of position bracket A should be engaged in notch B of the rotating hook. And there should be a clearance of 0.5~0.7mm in between.

6.2 Adjusting the feed dog

6.2.1 Adjusting the height of the feed dog

Turn the balance wheel to raise feed dog at highest position above throat plate. The proper height of feed dog above throat plate is 0.8~1.2mm (fig.31)

When adjusting the feed dog, first remove sliding ring, guard ring, needle, and make feed dog raised to highest position. Insert screwdriver into hole B to loose feed rockshaft crank clamping screw slightly and move the feed bar to adjust the height of the feed dog. Tighten clamping screw after proper height of feed dog obtained. (Fig.32)

For thick workpiece, proper height of feed dog is 1mm.

6.2.2 Adjusting and Fixing the position of the feed dog

1) Standard position of feed dog should be 1.5mm from the front edge of throat plate groove when the feed dog is fully advanced.

2) To adjust position of the feed dog as this:

Make the feed dog fully advanced, Insert screwdriver into hole C to loose feed crank clamping screw slightly and move the feed dog to adjust the clearance between the feed dog and edge of plate groove. Tighten clamping screw after adjustment.

6.3 Adjusting the tension releasing mechanism (fig.34)

The tension discs should be pushed apart when the presser foot is lifted. But the open timing of the tension discs can be adjusted by this:

Remove the rubber plug at the rear of the arm, loose screw A of the knee lifting lever (left), Then the tension releasing cam can be moved. Move rightward to defer releasing. Move leftward to faster releasing.

6.4 Adjusting the pressure of presser foot

Pressure should be set as per different workpieces by means of bellows:

Loosen lock nut B and b first.

Turn pressure regulating screw A and a in directions shown by fig.35 to increase the pressure for thick workpiece.

Turn screw A and a in reverse direction shown in fig.35 to decrease the pressure for light workpiece.

Fasten lock nut B and d.

6.5 Adjusting the top feed mechanism

6.5.1 Gc2301

1) Adjusting the amount of feed

Top feed can be adjusted either synchronized or differential with bottom feed by means of bellows (ref to fig.36a):

Loose nut to change center gauge A as shown. Increase A to increase top feed amount. Reduce A to decrease top feed amount. Fasten nut after adjustment. Each adjustment need a trial run to meet required synchronized or differential feeding.

2) Adjusting the alternate lift amounts of feet

For medium and heavy materials, walking foot lift amount should be within 5mm, while presser foot about 3mm. The 2 lift amounts can be changed with workpiece or sewing requirements by means of (The sum of the 2 lift amounts should be fixed if the mechanism is not modified) bellows (fig.36A):

Loose the clamping screw in the front crank for presser foot to free the crank. Turn the crank clockwise to increase walking foot lift amount and reduce presser foot lift amount. Turn it anticlockwise to get the opposite.

Tighten the clamping screw after adjustment.

3) Adjusting the total lift amount of the two feet. The total lift amount of the two feet can be adjusted (see fig.38) as per below details:

Loose the nut with a wrench, move the presser foot lift regulating screw to change its distance B with the presser foot lift shaft. Shorten B to get the reverse.

Tighten the nut after adjustment.

6.5.2 Gc2603

Raise presser feet with presser bar lifter and dial the stitch length to the max. Then turn the balance wheel slowly to check if the needle falls into the center of the hole in the feed dog (fig.37). If not, please proceed as per fig.39a-loose screw and turn the shaft to adjust, then tighten the screw.

Keep turning the wheel to make a full stitch. If the needle keeps fall into the center of the hole (Point B in fig.37), the top feed is correct. If needle falls on point A, the feed amount is too big. If it falls on point C, the feed amount is too small. Should either condition occurs; adjustment should be made as follows: Loose nut as shown in fig.36b, change center gauge A to adjust- Wider A to increase feed amount, reduce A to decrease feed amount-Tighten nut after adjustment.

2) Adjusting the alternate lift amounts of feet

For medium and heavy materials, small presser foot lift amount should be within 5mm, presser foot about 3mm. The 2 lift amounts can be changed as per workpiece or sewing requirements by means of (The sum of the 2 lift amounts should be fixed if the mechanism is not modified) belows (fig.36b)

Loose the clamping screw in the front crank for presser foot to free the crank. Turn the crank clockwise to increase small presser foot lift amount and reduce presser foot lift amount. Turn it anticlockwise to get the opposite. Tighten the clamping screw after adjustment.

3) Adjusting the total lift amount of the two feet

The total lift amount of the two feet can be adjusted (see fig.38) as per below details:

Loose the nut with a wrench, move the presser foot lift regulating screw to change its distance B with the presser foot lift shaft. Shorten B to increase total lift amount of feet, or to widen B to get the reverse. Tighten the nut after adjustment.

4) Adjusting the clearance between the presser foot and the walking foot

The small presser foot should have a clearance C (fig.39.) About 1.5mm with presser foot to prevent from striking each other during feeding. The clearance C should be adjusted as per fig.39.a when it's too big or small-loose clamping screw in rear crank. Turn the shaft clockwise to increase clearance C. Do the opposite to reduce.

If the needle penetrates right or left into the center point of the hole, adjustment can be made as this: loose setscrew B (fig.39.b) and adjust position of feed dog. Tighten screw B after adjustment.

After above 1),2),3)or4)is made,an inspection should be made as this: Raise feet with presser bar lifter,turn the balance wheel slowly to check if the presser foot and walking foot is hitting other parts. If it is, adjust again.

7. Periodical cleaning

Clean the feed dog, the rotating hook and the bobbin case periodically according to usage by means of this:

Remove the throat plate, the sliding ring and the bobbin case. Clean off the dust underneath and those clinging to the slit of the feed dog and the rotating hook, then brush bobbin case and rotating hook with soft rag.

8. Troubleshooting

Trouble	Possible causes	Solutions
Needle breakage	<ul style="list-style-type: none"> ① Needle too thin or bent ② Wrong installation of needle ③ Push or pull the materials with hand during sewing ④ Workpiece too heavy or thick 	<ul style="list-style-type: none"> ① Change with a suitable needle ② Ref to fig 13 on page 6 ③ Help feeding without pull or push ④ Use proper needle according to the technical specifications
Skip stitch	<ul style="list-style-type: none"> ① Needle bent or needle doesn't fit with the workpiece ② Wrong installation of needle 	<ul style="list-style-type: none"> ① Change with a suitable needle ② Ref to fig 13 on page 6
Needle thread breakage	<ul style="list-style-type: none"> ① Wrong needle threading ② Needle thread tension too strong ③ Poor quality thread ④ Needle too thin or too rough 	<ul style="list-style-type: none"> ① Ref to fig 16 on page 7 ② Ref to fig 24 on page 10.decrease needle thread tension ③ Change thread ④ Change with suitable needle
Bobbin thread breakage	<ul style="list-style-type: none"> ① Bobbin thread tension too strong ② Loose or uneven bobbin thread ③ Needle hole of throat plate too rough or worn out 	<ul style="list-style-type: none"> ① Weaken the bobbin thread tension ② Wind the bobbin again ③ Change the throat plate or polish needle hole with 0# emery cloth
Loose stitch	<ul style="list-style-type: none"> ① Improper adjustment of needle and bobbin thread tension ② Thread take-up spring tension too weak 	<ul style="list-style-type: none"> ① Readjust the needle and bobbin thread tension ② Adjust thread take-up spring as per fig 23 on page 9
Puckering	<ul style="list-style-type: none"> ① Workpiece too thin or stitch length too big ② Needle and bobbin thread tension too strong ③ Pressure of presser foot too strong 	<ul style="list-style-type: none"> ① Adjust accordingly ② Adjust tension stud' take-up spring and rubber screw on bobbin case ③ Loose pressure regulating screw
